

Executive Summary

The **Food Business Intelligence & Analytics System** is a multi-phase analytics project developed to transform a food business from basic product-level operations into a scalable, data-driven multi-stream enterprise.

The project began with **Phase 1: Single Dishes Analysis**, where individual menu items were evaluated to establish foundational profitability, pricing discipline, and product validation. This phase focused on identifying high-performing dishes, estimating profit margins, and understanding cost-to-price relationships. The outcome provided clear visibility into which products had the strongest commercial viability and created the baseline for future expansion.

Building on those insights, the business transitioned into **Phase 2: Corporate Meals & Catering Intelligence**, shifting from isolated product sales into structured service-based offerings. This phase introduced three core business streams:

- **Corporate Breakfast** — designed as a standardized, stable revenue model for recurring daily operations.
- **Corporate Lunch** — built as a flexible, higher-variation service model with stronger pricing and profit optimization potential.
- **Catering Gigs** — developed as a scalable tiered model focused on larger group events and high-revenue opportunities.

This transition marked a major strategic shift from product validation to **business model diversification**, allowing the enterprise to reduce dependence on a single revenue source while increasing operational flexibility and market reach.

Through the integration of **Microsoft Power BI** and **Python analytics in Google Colab**, the project evaluated:

- Revenue performance across all streams
- Profitability under simulated cost structures
- Operational consistency and efficiency
- Protein dependency and supply chain concentration
- Client segmentation and catering scalability
- Cross-stream business performance benchmarking

Key findings showed that:

- **Breakfast** emerged as the strongest operational stabilizer, providing consistent and predictable daily cash flow.
- **Lunch** demonstrated balanced profitability with clear opportunities for pricing optimization and menu diversification.
- **Catering** proved to be the strongest growth engine, delivering the highest revenue and profit concentration while showing strong scalability across larger client segments.

Overall, the project successfully evolved from a simple dish-level analysis into a full **Business Intelligence and Analytics System**, enabling strategic decision-making around profitability, scalability, diversification, and long-term business growth.

This system now provides a strong analytical foundation for future expansion into forecasting, optimization modeling, and customer segmentation.
